

Weather forecast (PRO only)

Weather forecast is a built in feature within GPX Viewer Pro. This functionality can be accessed by clicking on Weather in the left main menu. The forecast is displayed to the current location where the device is present. To refresh the forecast, users need to click on the three dots on the top of the screen, where the option appears.

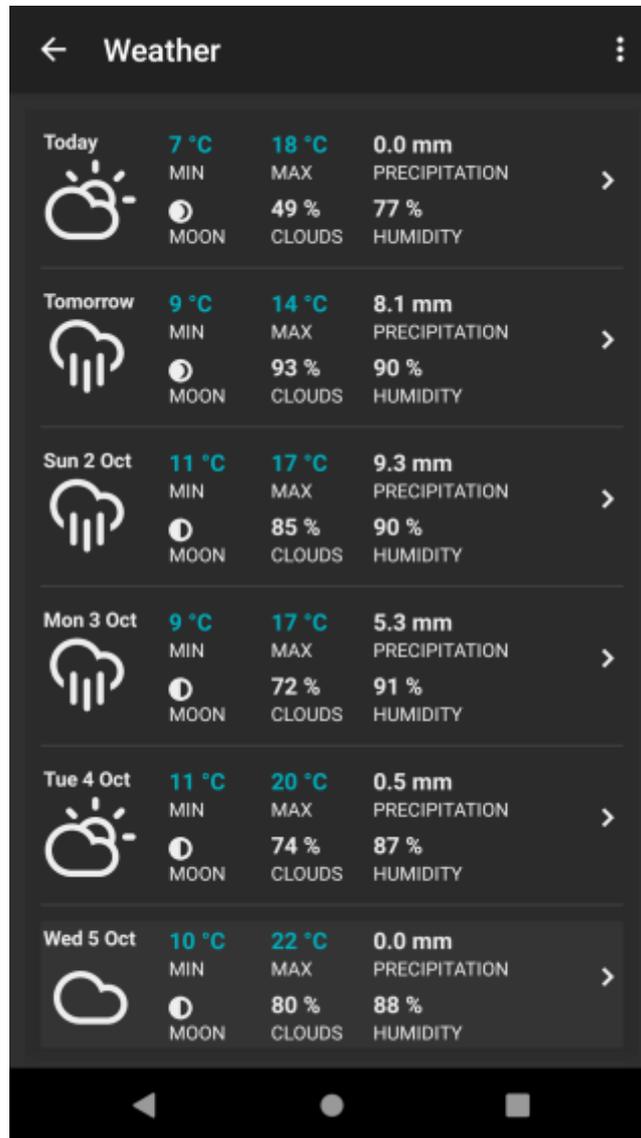

In the view users can see:

- Day and time to which values for these indicators are predicted.
- Temperature
- Apparent temperature
- Moonphase
- Percipitation
- Cloudiness
- Humidity
- Type of weather
- Wind speed
- Sunrise
- Sunset
- Visibility (after unrolling)
- Pressure (after unrolling)
- UV Index (after unrolling)
- Dew point (after unrolling)

Underneath these information users can find an hourly temperature graph. If you click on any point of the graph in a certain time, the other indicators are updated to their predicted value in that hour.

In the lower part of the screen you can find summary for each day of upcoming 7 days and after clicking on them their details are described in the main weather view on the top of the screen.
