

How to create generated icons

GPX Viewer supports generating custom color and text icons for waypoints defined in gpx or kml files.

In gpx files you can define in `<wpt>` tag `<extensions>` tag, then `<gpxwp:WaypointExtension>` tag into which you need to add `<gpxwp:icon>` tag. This is not included in gpx schema, so we are providing schema for this on this url:

<https://www.vecturagames.com/xmlschemas/GpxWaypointExtensionv1.xsd>. For example:

```
<wpt>
  ...
  <extensions>
    <gpxwp:WaypointExtension>
      <gpxwp:icon>...</gpxwp:icon>
    </gpxwp:WaypointExtension>
  </extensions>
  ...
</wpt>
```

Inside `<gpxwp:icon>` and `</gpxwp:icon>` tags instead of ... you can write functions:

1. **color_marker(color)** - instead of color you need to write color in RGB format, for example: `#aab51c`
2. **text_marker(string)** - instead of string you need to write maximum of three characters and minimum one character, for example: `100`

Examples for **color_marker(color)**:

```
<wpt>
  ...
  <extensions>
    <gpxwp:WaypointExtension>
      <gpxwp:icon>color_marker(#aab51c)</gpxwp:icon>
    </gpxwp:WaypointExtension>
  </extensions>
  ...
</wpt>
```

Result icon:

Examples for **text_marker(string)**:

```
<wpt>
  ...
  <extensions>
    <gpxwp:WaypointExtension>
      <gpxwp:icon>text_marker(100)</gpxwp:icon>
```

```
</gpxwpx:WaypointExtension>
</extensions>
...
</wpt>
```
