

Create map style for offline maps

Getting started by learning

At first, before starting creating map style we strongly recommend you reading at least three materials mentioned below. You need to have at least some basic understanding of data which are available for creating map styles and their categories. For this we recommend you reading Map School introduction:

- <https://mapschool.io>

Data for offline maps styles for GPX Viewer PRO are based on OpenStreetMap data so we recommend you reading this short article about OpenStreetMap data:

- https://wiki.openstreetmap.org/wiki/Beginners_Guide_1.3

Next there is a very good e-book from Mapbox about creating map styles, when you read it you will have some idea of what creating map styles mean and what you will be doing (you can download this guide for free, but you need to enter there your e-mail address):

- <https://www.mapbox.com/map-design>

Installing software and preparing for starting creating

In order to start creating map style for offline maps you need to install some software on your computer. Below are steps describing installing recommended software like text editor, PHP server and browser. We also provide you some example map styles for downloading.

1. Firstly you need some browser. We recommend you downloading and installing Mozilla Firefox: <https://www.mozilla.org/en-US/firefox/new>. When developing map style you will need some plugin to clear cache data as browsers are caching also style definition data which when style is changed isn't always reloaded. For this we recommend you Empty cache button with which you can simply by one click delete cache data: <https://addons.mozilla.org/en-US/firefox/addon/empty-cache-button>.
2. Next you need to install some text editor with syntax highlighting for yaml file format. We recommend you downloading and installing Atom: <https://atom.io>.
3. You also need server with PHP support. We recommend you downloading and installing EasyPHP Devserver, which has dependency on Visual C++ Redistributable C++ 2012 x86 package, which you can download and install from here: <https://www.microsoft.com/en-us/download/details.aspx?id=30679>. Then you can download and install EasyPHP Devserver: <http://www.easyphp.org>.
4. We have also prepared for you an archive with some fully featured map styles created by Mapzen which are open source. There is also one map style created by us and one base map style for creating map styles. You can download it here:

<https://vecturagames.com/gpxviewerpro/maps/maps.zip>.

5. You will need a Nextzen API key in order to get data for maps. You can register on their website and generate API key: <https://developers.nextzen.org>. After registering and generating API key you will need to paste it into index.html and replace text `paste_your_api_key_here` by this API key in these styles.

Here is video of the whole process of downloading and installing recommended software and also showing workflow of creating a map style. We strongly recommend you watching this video as not all steps are described above:

Reading documentation

Before you will be able to actually create a map style, you will need to study some materials. At first we recommend you learning about yaml syntax in which map styles are written. Here is a video where it is brilliantly explained:

- <https://www.youtube.com/watch?v=cdLNKUoMc6c>

After learning yaml syntax, you need to learn how to create map style by reading through Tangram documentation. Tangram is a software which GPX Viewer PRO is using for showing offline maps. Tangram is also in a web version which you will be using for creating a map style. We recommend you starting reading documentation in this order:

1. <https://tangrams.readthedocs.io/en/latest/Overviews/Scene-File>
2. <https://tangrams.readthedocs.io/en/latest/Overviews/Filters-Overview>
3. <https://tangrams.readthedocs.io/en/latest/Overviews/Styles-Overview>

Then you can read documentation on demand when you will need to know specific information:

- <https://tangrams.readthedocs.io/en/latest>

Additional information

Tangram Blocks are reusable map style snippets of shaders which you can import into your map style. It contains huge gallery of snippets which should make your life easier doing some complex styling using shaders:

- <https://tangrams.github.io/blocks>
