

How to add waypoint

Waypoints are arbitrary points on the map which to which you can assign icon, name, description and other data. In GPX Viewer PRO you can add arbitrary waypoints anywhere on the map. In this section we will describe how to open gpx file step by step:

1. Tap longer on the screen in the point you want to add the waypoint.
2. Tap on the new waypoint that appears and the information bar will unroll.
3. After clicking on "i" icon, you can get to the waypoint details where color, symbol, name, and other data can be changed.
