Track/Waypoint Importing and Exporting

In GPX Viewer PRO users have the ability to import and export the tracks and waypoints within their device.

Importing

To import track or waypoint from your storage memory to the application you need to open in the bottom menu bar either *Tracks* or *Waypoints*. After this screen displays in the top right corner you can find an Import button. Users can later choose the resource from where they want to take the file for import - Recents (recently opened files), Shared (files shared through iCloud) and Browse (within the whole memory space). Users can group the files by ther kind, date, size, shared by and sort out by name, date, size, tags.
