File importing and exporting

GPX Viewer PRO supports importing of gpx, gpz, kml and kmz files from device storage or cloud storages like iCloud. It also supports exporting int gpx and kml files. Gpx and kml files contains tracks, routes and waypoints. Gpz and kmz files are just compressed (zip archives) gpx and kml files respectively. You can find more information about gpx files on this website and more information about kml files can be found on this website.

On this help page there are information on How to import track or waypoint

FILES

Each file consist of information:

- Name of the file.
- Size of the file.
- Date of file creation.

After short tap on a file, the file is selected. Users can import also several files at once.

After long tap on files the following options display:

- Download
- Get info
- Rename
- Duplicate
- Quick Look
- Tags
- Copy
- Move
- Share
- Show in Enclosing Folder
- Delete

In a case more files are selected previous actions are executed for all of the selected files (except show full path and rename).
